361-504-6181 | rajeshna.dev01@gmail.com | <https://www.linkedin.com/in/rajndev> | Carlisle, PA

PROFESSIONAL SUMMARY

- Software Engineer with 5+ years of experience building internal platforms, workflow systems, and production web applications using TypeScript, Node.js, Python, PostgreSQL, and AWS.
- Delivered systems processing 2M+ daily transactions, improved latency from 220 milliseconds to 95 milliseconds, and raised automated test coverage from 42% to 88% across 12+ services.
- Strong background in REST APIs, relational data modeling, authorization controls, audit-friendly workflows, third-party integrations, and scalable operational software for regulated environments.

TECHNICAL SKILLS

Programming: TypeScript, JavaScript, Node.js, Python, Java, SQL, Scala

Frontend: React, Next.js, Angular, HTML5, CSS3, Tailwind CSS

Backend: NestJS, FastAPI, Spring Boot, Spring Framework, REST APIs, GraphQL familiarity, Web Services, microservices

Databases: PostgreSQL, MySQL, MongoDB, Redis, ClickHouse, relational schema design, schema migrations

ORM and Persistence: Prisma, Sequelize, TypeORM, Hibernate, JPA, SQLAlchemy

Security and Governance: authentication, role-based access control, audit logging, secure coding, authorization-aware access patterns

Cloud and DevOps: AWS, Docker, Kubernetes, Terraform, GitHub Actions, Jenkins, CI/CD

Messaging and Processing: Apache Kafka, event-driven architecture, background processing, webhooks, distributed interfaces

Tools: Git, GitHub, JIRA, IntelliJ, VS Code, Claude Code, Cursor

PROFESSIONAL EXPERIENCE

Capital One — Senior Software Engineer

May 2024 to Present

- Designed internal and customer-facing platform services using TypeScript, Java, SQL, and AWS, processing 2M+ daily transactions while improving end-to-end latency by 57%.
- Developed RESTful APIs and operational workflows supporting 15+ business journeys, increasing conversion by 38% while maintaining 99.9% uptime across production financial systems.
- Engineered PostgreSQL-backed query systems for 500K+ monthly users, sustaining sub-200 millisecond responses through indexing, schema tuning, and durable service-boundary design.
- Implemented reusable authorization-aware service interfaces and audit-friendly data flows, reducing duplicate implementation effort by 27% across four engineering teams.
- Authored technical designs, architecture notes, and implementation plans that improved onboarding speed by 30% and reduced long-term maintenance effort across shared platforms.
- Mentored junior and mid-level engineers through code reviews, pairing, and design feedback, improving delivery consistency across quarterly roadmap commitments and production support activities.

UnitedHealth Group — Software Engineer

Aug 2023 to Apr 2024

- Built Python and Spring Boot services with PostgreSQL, processing 500K+ daily transactions at sub-300 millisecond latency across healthcare and operational workflow applications.
- Integrated eight internal and third-party systems through secure API contracts, improving cross-platform data exchange reliability by 29% across billing, reporting, and support processes.
- Optimized SQL execution paths and backend bottlenecks, increasing throughput by 35% across reconciliation, reporting, and transaction-heavy services supporting 200K+ daily active users.
- Established maintainable testing and validation practices covering unit, functional, and regression scenarios, reducing defect rates by 38% across three engineering teams.

- Resolved recurring platform failures and service regressions, lowering issue recurrence by 26% across cloud-hosted business applications with strict operational reliability requirements.
- Collaborated with product, operations, and engineering stakeholders to translate ambiguous requirements into scalable technical solutions across deadline-driven business initiatives.

Accenture — Associate Software Engineer

Jul 2020 to Nov 2022

- Modernized Java and Python backend services for four enterprise clients, delivering releases 20% ahead of schedule across large-scale platform modernization programs.
- Streamlined CI/CD pipelines and deployment validation workflows, shortening release cycles from 30 minutes to 12 minutes across shared engineering environments and delivery processes.
- Configured event-driven integrations and service interfaces supporting \$2M+ in daily transaction volume per client at sub-200 millisecond processing latency.
- Investigated processing bottlenecks and inefficient transformation logic, reducing overall latency by 42% across high-scale deployments supporting 100K+ daily active users.
- Migrated legacy integration logic into service-oriented interfaces, improving data exchange consistency by 27% across enterprise applications with complex upstream and downstream dependencies.
- Standardized maintainability and review expectations across shared modules, reducing escalation volume by 22% across production support and release management activities.

PROJECTS

LLM Document Summarization System | Python, LangChain, FastAPI, AWS

- Formulated a FastAPI summarization service using LangChain and AWS Lambda, processing 10,000+ pages daily with 94% accuracy across five document categories.
- Orchestrated chunking, embedding, and summarization workflows on AWS S3, reducing average processing time from 45 seconds to under 6 seconds per document.

AI Chatbot with RAG | LangGraph, Pinecone, OpenAI, React

- Scaled a React chatbot using LangGraph and Pinecone vector retrieval, achieving 89% answer relevance across 50,000+ user queries in production-style support workflows.
- Enhanced retrieval-augmented response handling with structured context pipelines, reducing hallucination rate by 43% compared with zero-retrieval baseline behavior across user scenarios.

Real-Time Anomaly Detection System | Kafka, Python, Prometheus, AWS

- Monitored a Python Kafka consumer pipeline processing 1M+ events per hour, sustaining sub-500 millisecond anomaly detection latency across streaming operational workloads.
- Quantified observability improvements through Prometheus and Grafana dashboards, reducing mean anomaly detection time from 12 minutes to under 90 seconds across distributed services.

EDUCATION

M.S. Computer Science — University of Central Missouri — **May 2024**

B.Tech Information Technology — Kakatiya Institute of Technology and Science — **May 2022**
